WHY (Rationale behind establishing the Support model)

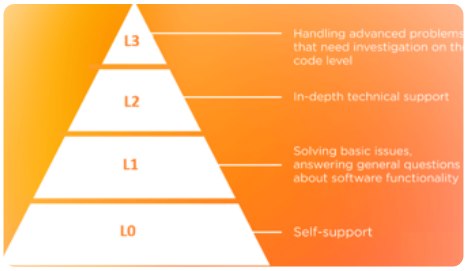

Since the launch of AI Foundry in August 2025 , the AI Platforms - Portkey (AI Gateway) and n8n (Agent builder) have seen significant growth in Syngenta .

As we prepare to launch additional products within the AI Foundry such as AI Knowledge Base, AI Evaluation with Confident AI , it is imperative that AI Foundry team has a comprehensive support model for Users and the team is ready to respond to unplanned events that can affect service quality or service operations across our platforms and products.

Our primary objective is to **enhance the User Experience by delivering faster response times and more reliable technical assistance**, thereby ensuring the seamless operationalization of our evolving AI ecosystem

Support Model - Tiers

Support model is typically organized into three main tiers:

- **Level 0 - Self Service:** User Relies on Self serve support model through FAQ Portal, Knowledge base , AI Developer Portal etc.
- **Level 1 - Service Desk:** focuses on resolving basic issues quickly and pass on complex problems to higher tiers. This team serves as the initial point of contact for users, logging basic issues and conducting preliminary troubleshooting. Service desk agents adhere to predefined scripts and SOPs to ensure consistent handling of queries.
- **Level 2 - Technical Support:** When issues cannot be resolved at the service desk, they are escalated to the technical support team. This tier requires a higher level of technical expertise to tackle more complex problems.
- **Level 3 - Specialist Teams:** The specialist teams possess the expertise in specific domains - such as code / configuration related failures, Infra & network design issues such as routing problems, Security issues (certificate errors, policy violations) and in some cases Product design issues . They address the most intricate and complex technical challenges.

Incident Management Process for AI Foundry

1. Issue Detection

***Triggers**:*

- **Manual**: User reports a Query / Problem on AI Foundry Support Channel
- **Automated**: DataDog monitor triggers an alert. On-call engineer receives notification and notified L2 team as needed

2. Initial Triage & Verification

- ***Action**:*

The Level 1 Support team's On-Call engineer investigates the reported incident to determine whether the issue is real or a false positive.

- acknowledge the issue promptly
- connect with the Users
- conducting preliminary troubleshooting . Service desk agents adhere to predefined scripts resources and workflows to ensure consistent handling of queries.
- ensure the issue is logged as a ticket in Jira (Already Automated)

4. Incident Declaration

- ***Decision Point:***
  - If it is a User Query and No incident, the **Level 1 Support team** records the outcome in respective Jira ticket (e.g. User query on new workspace in portkey , wrong base url etc. wherein no action / issue resolution needed).
  - If Yes - It is an Incident , escalate it to Level 2 Support team for AI Platform :
    - Assign priority level in Jira
    - Notify **Level 2 Support team** (e.g. via Slack, Teams, or email) , Provide Jira Incident
    - Create a shared incident channel or war room if needed

5. Incident Response

- **Level 2 - Technical Support:** When issues cannot be resolved at the service desk, they are escalated to the technical support team. This tier requires a higher level of technical expertise to tackle more complex problems.
- ***Action****:*
  - Troubleshoot and mitigate the Incident .
  - For complex and Priority issues, engage Level 3 Support teams as needed for faster resolution
  - Communicate status updates periodically on AI Support Channel .

6. Incident Resolution

- ***Trigger****:* Issue is resolved by Support team and systems return to expected behavior.
- ***Action****:*
  - Resolve the Issue .
  - Log resolution steps.
  - Update monitors or alerts if needed

7. Postmortem

- ***Action****:* Conduct a blameless postmortem.
  - Postmortem document should be created and saved in Confluence - AI Foundry Postmortem Reports
  - It typically includes :
    - Timeline of events
    - Root cause analysis
    - Impact summary
    - Communication review
    - Postmortem can’t be completed until all action items have Jira tickets.

8. Improvements & Follow-Up

- ***Action****:*

- Implement long term measure /remediations (e.g. infra changes, alert tuning).
- Track action items in Jira.
- Share learnings across teams.

Incident Priority Levels

	Description	Visible to Users	Jira Ticket Required	Support Channel Notifications , Regular updates
P1 - Critical	Hard down on one platform complete service outage	Yes	Yes	Yes, use announcement and support channel
P2 - High	Core features of a platform are unavailable	Yes	Yes	Yes use announcement and support channel
P3 - Medium	Non-core feature is unavailable	Yes	Yes	Yes
P4 - Low	Some impact on user experience, but there are workarounds available Informational , User Queries , Education, very limited, small # of users impacted, does not impact user experience	Yes	Yes	Yes(to the user)

Incident Status

Status	Description
Open	Team has determined priority for the issues reported . Team is actively investigating and/or addressing the issue causing service disruption.
Resolved	Users are no longer experiencing issues. Team has made fix (if needed) and can switch from “emergency mode” to “recovery and prevention mode” This status indicates there are still post incident actions required
Closed	Team has conducted in-depth postmortem. Root cause of issue has been identified and systems are back to 100% performance.

Support Performance Metrics

Metrics & Reporting - Monthly Review

Time to Respond

The time elapsed until the acknowledgement of an issue.

Time to Resolve

The time elapsed until the incident is Resolved.

Stakeholders Communication

Shows if the Stakeholders are notified or not in Yes/No format.

Postmortem Conducted

Shows if a postmortem was published or not in Yes/No format.

SLA -

Performance Indicator and description	Standard Service Level
P1 / P2/P3 Incident Response	30 mins

P1 Incident Resolution	8 hours
P2 Incident Resolution	2 Days
P3, P4 Incident Resolution	4 Days
P1, P2 RCA submission	4 days

Scope of activities for L1,L2,L3 Support in AI foundry

Excel List of Activities for L1, L2 scope

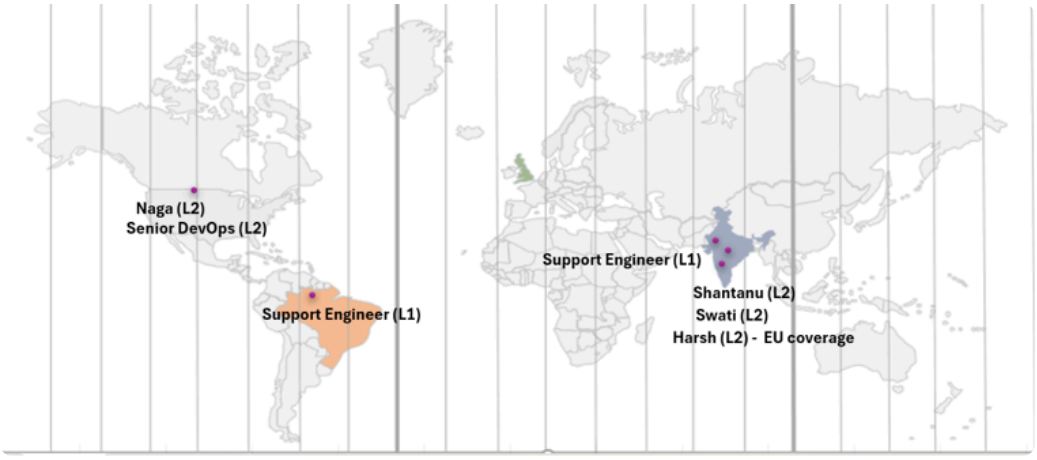

24*5 Support Coverage for AI foundry

L1 Support Team - 2 People providing Global Coverage

- 1 in IST time zone for AMEA and EU
- 1 in Brazil to provide coverage for NA_LATAM Time zone

L2 Team Distribution as below . The 4 hours gap in above map can be covered by Naga and Sr. DevOps Engineer in NA (as needed)

Future Scope

The L1 Support can be expanded to Data Mesh Support coverage as well in future .

AI Foundry L1 support may need expansion (additional L1 engineers to cover various time zones) based on adoption , number of users , additional products
