RFC: Pre-Meeting Preparation Agent

RFC created by	Zohaib Shahid
Scope	Local: France pilot. Designed so other countries can be added later
Entry date	Oct 22, 2026
Status	OPEN FOR COMMENTS draft
User journey	https://digitial-product-engineering.atlassian.net/wiki/spaces/FCD/pages/6407324720

> Draft RFC. Items marked **TBC** are not yet confirmed; unresolved items are listed in the open decision tables.

This RFC proposes an assistant that turns a short meeting brief into an editable first-draft PowerPoint, using approved data and a standard template. The sales rep keeps final control. The immediate decision is whether to proceed with the MVP approach and delivery plan for a France pilot by **15 December 2026**, while escalating a small set of business, data and security decisions that must be resolved.

Problem

Sales reps spend substantial time preparing for customer meetings, roughly **10.5–18 hours per meeting**, depending on meeting type.

- Framing the meeting: 30–60 minutes
- Searching for information: 3–5 hours
- Analysing the account and market: 2–3 hours
- Collecting technical evidence: 1–2 hours
- Building the PowerPoint: 3–5 hours
- Review and rehearsal: 1–2 hours

The main causes are fragmented information, inconsistent deck versions across regions, manual evidence gathering, and slow collaboration through files and email. Market analysis also often requires ad hoc support from the Market Activator.

Requirement. Generate a trusted, editable first draft from a short brief, without removing the sales rep's authority to review, edit, and decide what is shared with the customer.

Context and scope

The target business workflow has six steps: confirm meeting context, generate a trusted account view, review opportunities and risks, generate story and materials, validate collaboratively, and finalise the customer package.

Related user journey. The detailed `https://digitial-product-engineering.atlassian.net/wiki/spaces/FCD/pages/6407324720` is part of this RFC section and should be used as the workflow reference for meeting-context capture, retrieval, customer view, recommendation approval, deck generation, refresh, and approval loops.

The MVP covers

- Step 1 fully: confirm meeting context.
- Selected data and story elements of steps 2 and 4.

The MVP does not cover

- Rep feedback loops, revised versions, or learning from edits.
- Searching across existing PowerPoint and Excel files.
- Automatic deck creation from Outlook meetings.
- Offline or mobile use, shared editing, or version history.
- The voice-to-text assistant, which is planned separately later.

Persona. Sales rep in the French team.

Decision criteria

- **Trusted outputs:** numbers come from approved data, not from the language model's calculations.
- **Editability:** output is real PowerPoint, not pictures of slides.
- **Alignment with company platform:** reuse approved company services for hosting, access and AI models.
- **Security and compliance:** respect data permissions, limit what is shared with the AI model, keep a human in the review.
- **Delivery speed:** a usable France pilot by 15 December 2026.
- **Extensibility:** more countries and meeting types later through configuration.

Proposed solution

How it works for the rep

1. The rep opens the assistant from the Lynx agent section if available in time; otherwise from a small standalone screen – AGUI.
2. The rep enters the customer, meeting type, meeting length, and a short brief of 2–3 sentences.
3. The assistant asks follow-up questions only if mandatory input is missing.
4. The assistant runs in the background, reads customer sales data, builds tables and charts from the numbers, and writes the storyline with the language model.
5. The assistant produces an editable PowerPoint, saves it to a pre-configured SharePoint folder, creates a "version 1" record in Salesforce with the link, and notifies the rep by email and in-app.
6. The rep reviews and edits the deck. **The assistant never sends anything to the customer.**

The first MVP version covers **one confirmed meeting template: the Business Review and Outlook template, confirmed by business owner Akshay**. Slides vary by meeting type, not by customer.

Principles

- **One assistant, two possible entry points.** Lynx or a standalone screen.
- **Numbers from approved gold data from Databricks, story from the model.** The model does not calculate business numbers.
- **Runs in the background.** A deck can take minutes to hours.
- **One template per meeting type.**
- **Read-only access** to source data through a fixed question; current MCP gateways only have read access, transmutational operations: delete, create, update not allowed.
- **Reuse company services** instead of building new infrastructure.

Options analysis

Topic	Proposed option	Alternative	Trade-off
Deck information	Do not ask for data in plain language	Use plain-language data requests	Fixed questions are more reliable and repeatable; plain-language requests may vary between runs
Front end	Lynx if ready; standalone	Build on AGUI	Flexible entry point;

	screen otherwise		dependency on Lynx timing is reduced by the standalone screen
Saving the deck	Ask the platform team for a supported route; download as interim fallback	Assistant connects to SharePoint and Salesforce directly	The supported route is more compliant with current platform rules; direct connections may conflict with platform controls

Recommendation. Proceed with the MVP: read-only data access, numbers from approved data, editable template-based decks, central control of AI model use, and download as the fallback if saving to SharePoint and Salesforce is not ready.

Open decisions

#	Decision	Possible approach
1	How the deck is saved to SharePoint and Salesforce	Use the platform-supported route when available; provide download as the interim fallback
2	Lynx integration route and timing	Lynx calls our assistant; use a standalone screen in the meantime if Lynx is not ready
3	Where job progress is recorded	Use the platform's memory or a small store to track deck-generation jobs, version events, data refresh events, and audit history

Data sources and coverage

The MVP will use approved France gold data from Databricks and the workflow reference in Confluence. Source coverage is limited to the confirmed tables and sources below; pricing coverage is **TBC**.

Source	Use in MVP	Status
`gld_france_sales_customer_sales`	Customer sales, trends, account view, and chart-ready numbers for the Business Review and Outlook deck.	Access granted
`gld_france_sales_product_mix`	Product mix, category contribution, and supporting evidence for opportunity and risk discussion.	Access granted
Confluence user journey	Workflow reference for context capture, retrieval, customer view, recommendation approval, deck generation, refresh, and approval loops.	Linked from this RFC.
Mural working board	Discovery notes and visual mapping for the meeting-preparation workflow.	`https://app.mural.co/`

Validation requirements. Before using generated decks with pilot users, the team must validate table definitions, available fields, freshness, customer and purchasing-group identifiers, permission behaviour, and how encrypted protected fields are decrypted for approved use. Any missing pricing data or non-validated source must remain marked **TBC** in the deck and RFC decisions.

Data protection and compliance

- **Respect source permissions:** data is read with the rep's own identity, so the rep only sees what they are already allowed to see.
- **Restrict who can use it:** access is limited to named user groups.
- **Read-only source access:** the assistant cannot modify source data.
- **Protected fields:** customer and purchasing-group names are encrypted and may only be decrypted in approved situations.
- **Customer-safe output:** sensitive inputs may inform the draft but are not automatically exposed in customer-facing slides.
- **Human in control:** output is always a draft for rep review.
- **Approved claims:** customer-facing material uses approved claims, disclaimers, language, and branding.
- **Central model governance:** all language model use goes through one company service that logs usage and costs, manages prompts and applies safety rules.
- **EU hosting preference:** platform services and models should run in EU regions where possible.
- **Data freshness:** France sales data refreshes daily, with possible upstream delays of up to about 48 hours; the deck should show when the data was last refreshed.

Open decisions (security and compliance)

#	Decision	Possible approach
1	Long-running jobs outlasting the rep's sign-in	Confirm how long jobs stay authorised
2	Rep data permissions	Confirm or grant access through the data team
3	Approval path for decrypting customer names	Approved decryption through the company's secure store
4	What data may be sent to the model	Send only what the storyline needs
5	Storage and retention of decks and job data	Restricted SharePoint folder; company retention policy

6	Audit logging requirements	Log inputs, sources, generated content, and exports
7	Claims and disclaimer review	Rep review; compliance check if required
8	Required reviews before go-live	Identify the architecture and security review path early

---

Interdependencies and risks

Dependency	What is needed	Status	If it slips
Lynx team	A way to host the assistant in Lynx	Discussions started; no code access yet	Use the standalone screen first and integrate with Lynx later
AI Foundry platform team	Approved save route, access setup, test environment, model access	Onboarding in progress	Build locally and deliver by download first
Data and Databricks teams	Read access, rep permissions, missing data	Access requested; expected around two weeks	Develop against sample data
Business team	Templates, layouts, meeting-type content, sample decks	Requested, not yet received	Start with one agreed layout
Salesforce team	A place for the "version 1" link	Open	Deliver the link only by email

	record		and in-app
SharePoint owner	Output folder and permissions	Open	Download instead
Market Intelligence use case	Panel data requested by the France team	Open	Build without panel data
Customer 360	Shared customer view and identifiers	Open	Align definitions later

Key risks: no supported way to save to SharePoint and Salesforce in time, Lynx not ready, data access delays, and late template changes. The current mitigation is to keep the assistant independent of any one screen, use a standalone screen as fallback, develop against one fixed question, and start with one template.

Resources

Expected resourcing includes a small engineering team (1–2 people), access to the company AI platform's test environment and model access, a SharePoint folder, and a language-model usage budget tracked through the central AI service.
